

# Microprocessor 8086 part-2

## pins description

### i) $AD_{0...15}$

এই পিন দুইটি pin শেয়ার করে, Address and Data. এটি একইসাথে হল multiplex pin

### ii) RD (Read Data)

memory / IO device থেকে Data read করতে  
এই Use ২৫।

RD  $\rightarrow 0$  means Read operation শুরু  
RD  $\rightarrow 1$  " " " " " " " " " " " "

### iii) WR $\rightarrow$ Write data

cpu  $\rightarrow$  memory / IO device  $\rightarrow$  Data write  
এই Use ২৫

WR  $\rightarrow 0$  means Write  
WR  $\rightarrow 1$  " " " " " " " " " " " "

#### iv) $m/\bar{IO}$

$m/\bar{IO} \rightarrow 1$   $\Rightarrow$  memory operation

$m/\bar{IO} \rightarrow 0$  " I/O operation

#### v) INTR

Maskable (can be disabled) interrupt

$INTR=1 \rightarrow$  interrupt request sent to CPU

$INTR=0 \rightarrow$  no interrupt

#### vi) NMI

non-maskable interrupt (high priority interrupt) ~~(ignore this pin)~~

NTRA (Interrupt Acknowledgement)

#### vii) Ready

$Ready=1 \rightarrow$  Device Ready (CPU continue)

$Ready=0 \rightarrow$  Waiting state (CPU wait)

#### viii) Reset:

currently, the program of MP is not terminate

If Reset pin is activated for at least 4 clock cycles then, currently running program gets terminated immediately.

### ix) Hold

Hold  $\rightarrow 1$  and Others device bus control for

### x) Hold A

Hold Acknowledge  $\rightarrow 1$  and CPU control for

### xi) DTR (Data transmit/Receive)

Set direction of data bus

DT/R  $\rightarrow 1$  and CPU  $\rightarrow$  memory (Transmit)

DT/R  $\rightarrow 0$  " " memory  $\rightarrow$  CPU (Receive)

### xii) CLK:

Clock signal  $\rightarrow 0/1$  change and timing control

Clock = 1 and input or output is or  
clock = 0 " input or output is  
not

### xiii) $m\bar{n}/\bar{m}x$

$m\bar{n}/\bar{m}x = 1$  অর্থাৎ minimum mode

$m\bar{n}/\bar{m}x = 0$  " maximum "

### xiv) BHE

Bus high enable. 8 bit Register 8 bit, Data bus 16 bit হওয়ায় 8 bit নিয়ে কাজ করতে পারবে।

$BHE = 1 \rightarrow$  DB এর high 8 bit নিয়ে কাজ করতে পারবে

$BHE = 0 \rightarrow$  " " Low " " " "

### xv) $A_{16}/S_3 \dots A_{10}/S_6$

High address BUS ( $A_{16} \dots A_{10}$ )  
Status signals ( $S_3 \dots S_6$ )

### xvi) ALE and DEN:

ALE  $\rightarrow$  Address Latch enable

DEN  $\rightarrow$  Data bus enable.

Mainly  $AD_0 \dots AD_{15}$  pin এ সুন্দরভাবে দিয়ে  
যদি Data bus, যদি Address আর তা  
Decide হবে এই ১৬ pin নিয়ে।
