

Spiral model: waterfall + Iterative मिश्रण  
माना [risk कम]   
↳ prototype होना चाहिए

It is a software Development Life cycle (SDLC) model that combines features of the waterfall and iterative models. It provides a systematic, iterative approach with a strong emphasis on risk handling.

The four phases:

1. planning: focus on:

- ① clarifying project aims
- ② Gathering requirements
- ③ Identifying objectives
- ④ proposing alternative solutions

2. Risk Analysis:

this is the most critical phase.

- ① Evaluating proposed solutions.
- ② Identifying associated risks.
- ③ Resolving those risks.
- ④ often involves building a prototype, to

find the best possible solution,

### ③ Development:

① developing and verifying the identified features

② This phase includes coding, integration, testing.

③ the result is the next version of the software.

### ④ Review:

① customers evaluate the developed software version.

② Feedback is gathered.

③ planning for the next iteration begins.

☐ why spiral model call meta-Model?

The spiral model incorporates the stepwise approach of the classical waterfall model.

The spiral model uses the approach of the prototyping model building a prototype at the start of each phase as a risk handling technique.

Also, spiral model can be considered as supporting the Evolutionary model.

Advantage:

- ① Good for large projects.
- ② Flexibility in requirements
- ③ customer satisfaction
- ④ Improve communication
- ⑤ Improve quality

dis: ① complex, Expensive

- ② Too much dependency on risk management
- ③ Difficult in time management.

when to use:

- ① requirement જાદિન ચા- વાવવા, change  
રૂઝવા સમુપના ચાલે
- ② high risk, ટૂંક project.
- ③ સક્ષત user feedback નિતે વાવ વાવ  
prototype realise (દેખ્યા રૂઝ્યા)
