SE Lab Project Proposal Guideline

Each team will have **10 minutes** to present their proposal. The proposal should be structured into **4 main sections**:

---

1. Problem Identification (Backed by Data)

- **What problem are you solving?**
    - State the problem clearly in simple terms.
    - Why is it important or interesting?
- **Evidence / Data:**
    - Share at least a few basic statistics or facts (e.g., research peppers, news coverage, articles etc.).
    - If possible, highlight a **real-world impact** (e.g., healthcare, education, social benefit).

---

2. Solution (The Idea and Features)

- **Your solution approach:**
    - **ONE SINGLE LINE** to describe your project. The idea is that your single line should be able to explain your project to a kid or your parents.
    - What will your model/system do?
- **Main features / outputs:**
    - What will the end system be able to perform.

    - Example: "Our app will be able to transcribe medical conversation," or "Our chatbot will answer questions about university courses."

- Keep this section **idea-driven**, not too technical.

---

3. Plan of Action (High-Level Technology Overview)

- **What technologies will be used and why?**
    - Mention frameworks (e.g., React, Python, TensorFlow, PyTorch, Scikit-learn).
    - Mention libraries for specific tasks (e.g., Pandas for data handling, Matplotlib for visualization).
- **Feature-wise plan:**
- Keep it **high level** (don’t go deep into code).

---

4. Timeline
