

You need to implement a http server using python socket programming.

Your tasks:

- Create a server socket and make it listen to port number 8080 on your localhost
- From your browser you should be able to load <http://localhost:8080/>
- Keep at least three html files including but not limited to index.html, about.html and render them according to request
 - For <http://localhost:8080/> you should render index.html
 - For <http://localhost:8080/index.html> you should render index.html
 - For <http://localhost:8080/about.html> you should render about.html
 - i.e. the file corresponding to the path the user enters
- You should append the html contents of the file after the HTTP response text header:
i.e. the following text should be at the first of the response string:

`HTTP/1.0 200 OK\n\n`

- If any invalid url path is requested render NOT FOUND

`HTTP/1.0 404 NOT FOUND\n\n`
